Work Plan

WP-A
Mechanical and adhesion resistance

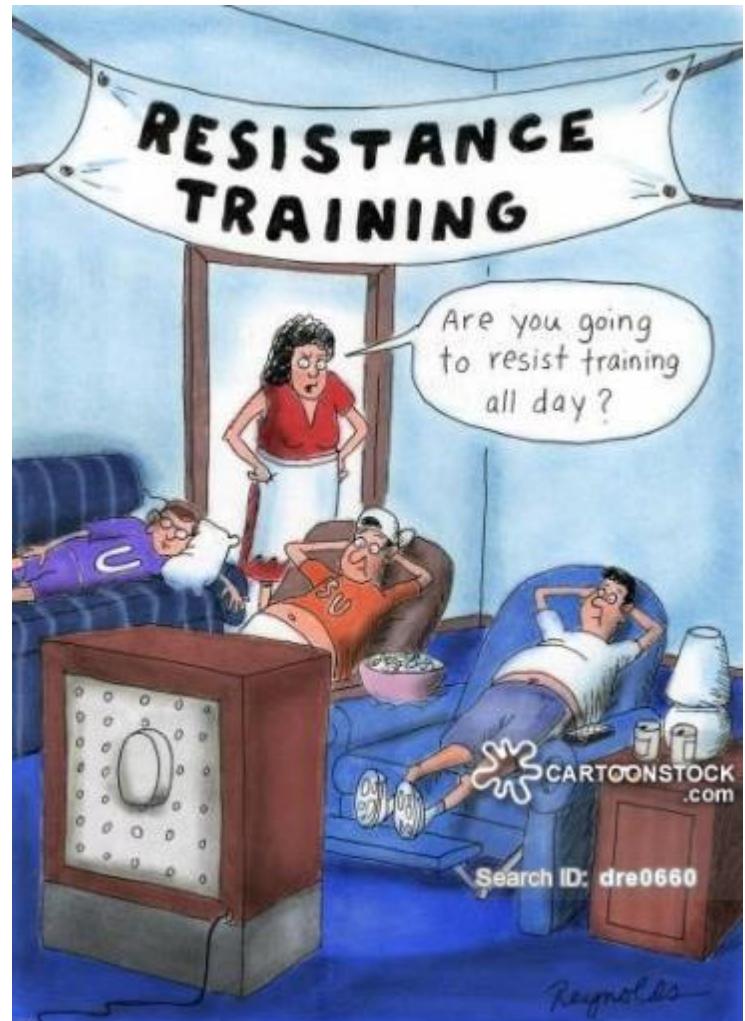

WP-B
Short-term methods

WP-C
Long-time prognosis

WP-D
Dissemination and Meetings

| Work Package | Activity/Task |
|--------------|---|
| WP-A | Mechanical and adhesion resistance |
| Task-A1 | Definition, production and providing of samples with different furniture edges |
| Task-A2 | Methodological investigations on new test methods on impact on egdes and rims |
| Task-A3 | Methodological investigations on new test methods on adhesion resistance on rims |
| Task-A4 | Comparative tests of the optimised methods on mechanical resistance |
| Task-A5 | Round robin tests of optimized test methods on mechanical resistance |
| Task-A6 | Final description of suitable methods for mechanical resistance |
| WP-B | Short-term methods |
| Task-B1 | Definition, production and providing of samples with different furniture edges |
| Task-B2 | Methodological investigations on new test methods on damp and water resistance |
| Task-B3 | Methodological investigations on new test methods on contact heat and temperature resistance |
| Task-B4 | Comparative tests of the optimised short-term test methods |
| Task-B5 | Round robin tests of optimized short-term test methods |
| Task-B6 | Final description of suitable short-term methods |
| WP-C | Long-time prognosis |
| Task-C1 | Definition, production and providing of different coating/glue materials and furniture edges |
| Task-C2 | Investigations on aging behaviour of coatings and glues under the influence of temperature and humidity |
| Task-C3 | Methodological investigations on long-term prognosis |
| Task-C4 | Comparative tests of the developed long-term methods |
| Task-C5 | Round robin tests of optimized long-term methods |
| Task-C6 | Final description of suitable long-time methods |
| WP-D | Dissemination and Meetings |
| Task-D1 | Conference papers or articles |
| Task-D2 | Technical reports and draft descriptions of test methods |
| Task-D3 | User Committee Meetings |
| Task-D4 | Project promotion - website, fairs, branch magazines etc. |

- Time shift about 6 months.
- New test resistance device with different impact masses constructed.
- Comparative tests finished.
- RRT started, more participants needed.

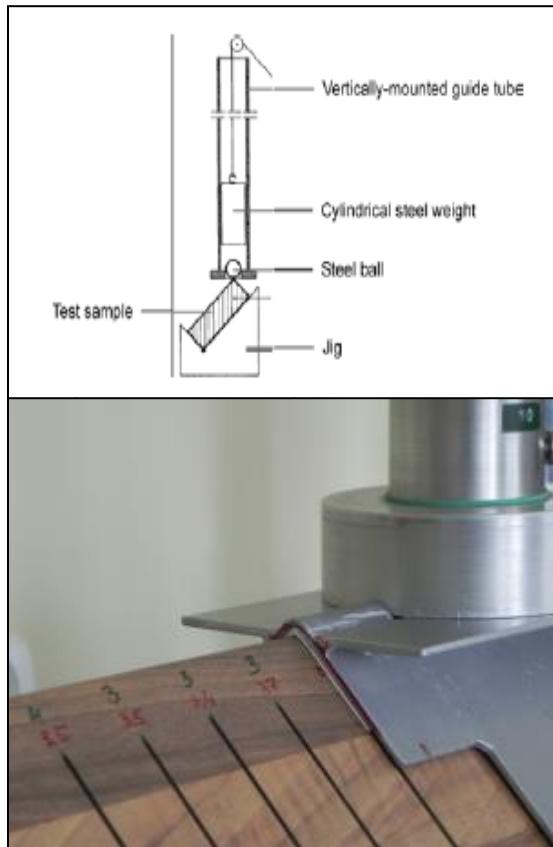

Background – IKEA impact method

- Applicability: finished fronts and worktops subjected to mechanical damage
- Impact test apparatus with a tube, cylindrical steel weight, steel ball (**14 mm**)
- Jig with milled groove which forms an angle of 45°

Background: IKEA impact method

- 5 measurement points with a spacing of 20 mm
- Ball **centered** and touching the edge
 - Ball does not always touch the edge because of the different types of edge profiles.
- Application of indicator to identify impact mark
- 45° (rim): **Only worktops**
- 90°: Top surface
- Results:
 - rating 1-5 based on impact mark and damages like cracks
 - the largest impact mark diameter decides
 - problem: mark measurement

Approach: a new method based on resistance to impact acc. to IHD works standard 470 (90 ° / 45 °) for indoor doors

- Testing of door edges with: edge band, HPL, CPL, coatings on wood.
- Free fall of a steel ball from a defined height on the tested edge or narrow surface.
- Evaluation of the realized impact footprint.
- Assessment of other errors (delamination, edge-peel-off etc.) not included anymore.
- Only the criterion cracks / no cracks shall decide at the end!

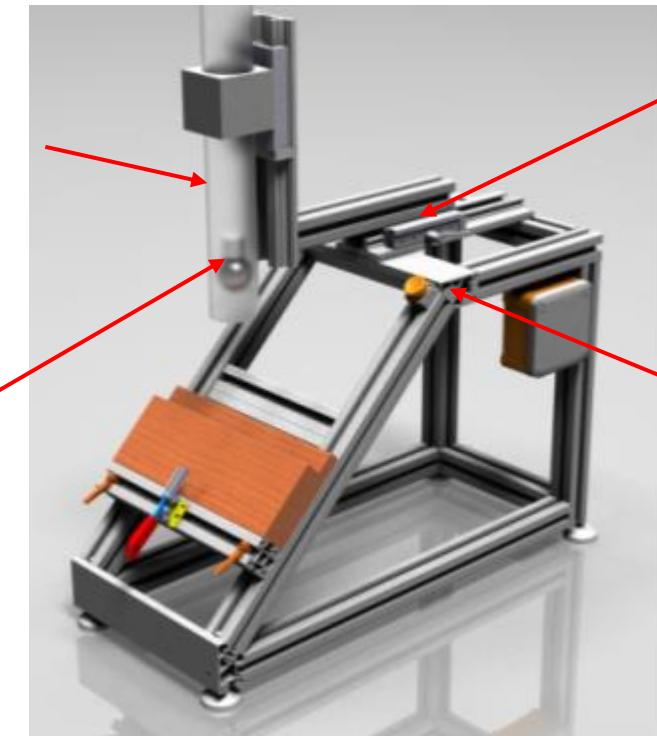

Appliance 1 (prototype):

Based on resistance to impact acc. to IHD work standard 470 (90° / 45°)

Downpipe with
adjustable height
and measuring scale

Electromagnet with
steel ball and
adjustable height

Modification:
**adjustable falling
mass**

Shifting appliance for the
downpipe for positioning
over the tested edge

**Open question:
positioning of the ball**

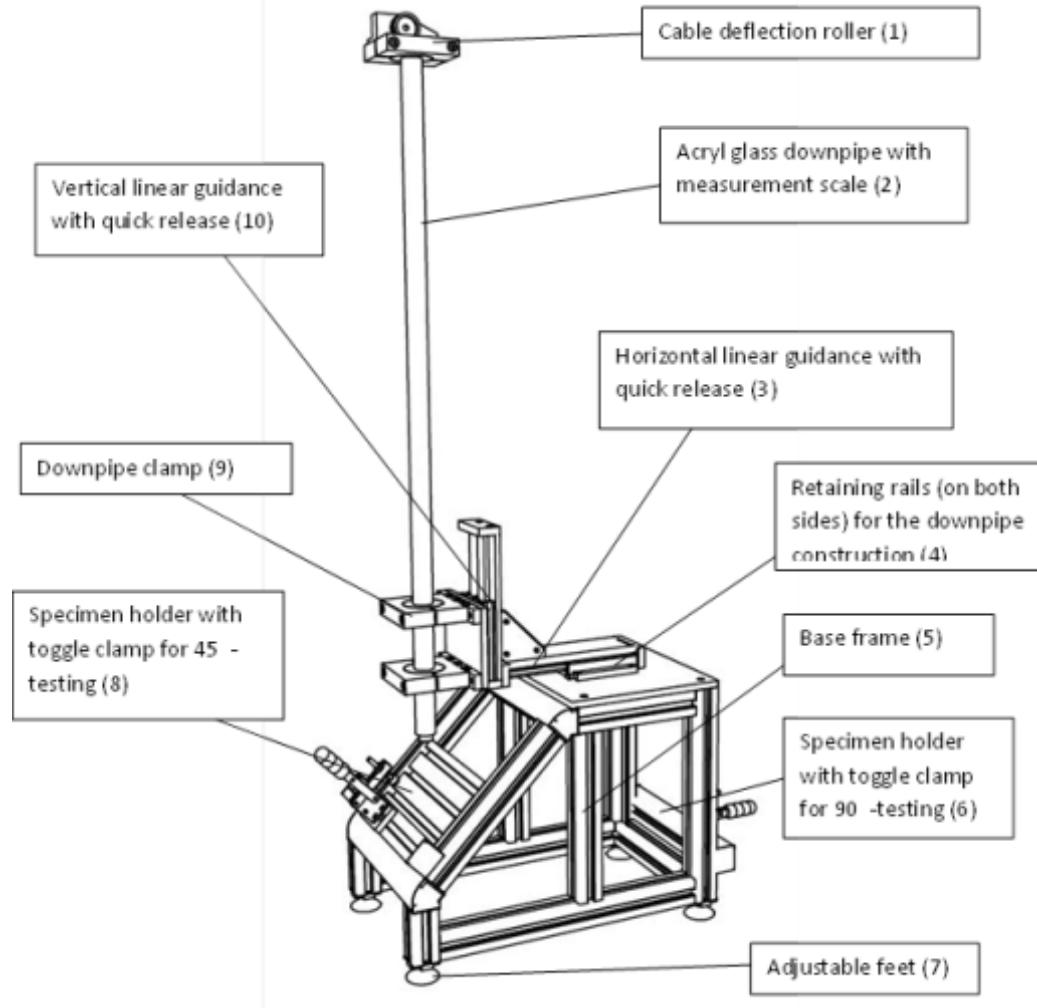

Optional hinge for change
of impact angle between
45 ° and 90 °

**Modification:
testing at 90 °
at the rear side**

Conclusions from the previous investigations

- Colouration of the cracks is helpful.
- Easy assessment also with patterned rims, if the rim is well formed.
- Accurate positioning of the ball is important.
- Differentiation between different types of cracks does not seem reasonable.
- For furniture parts, damages can occur at top surface and edge or on one of both – clear assessment method necessary.
 - The biggest damage decides.

Appliance 2: Finished testing device with different impactors

Appliance 2: Finished testing device with different impactors

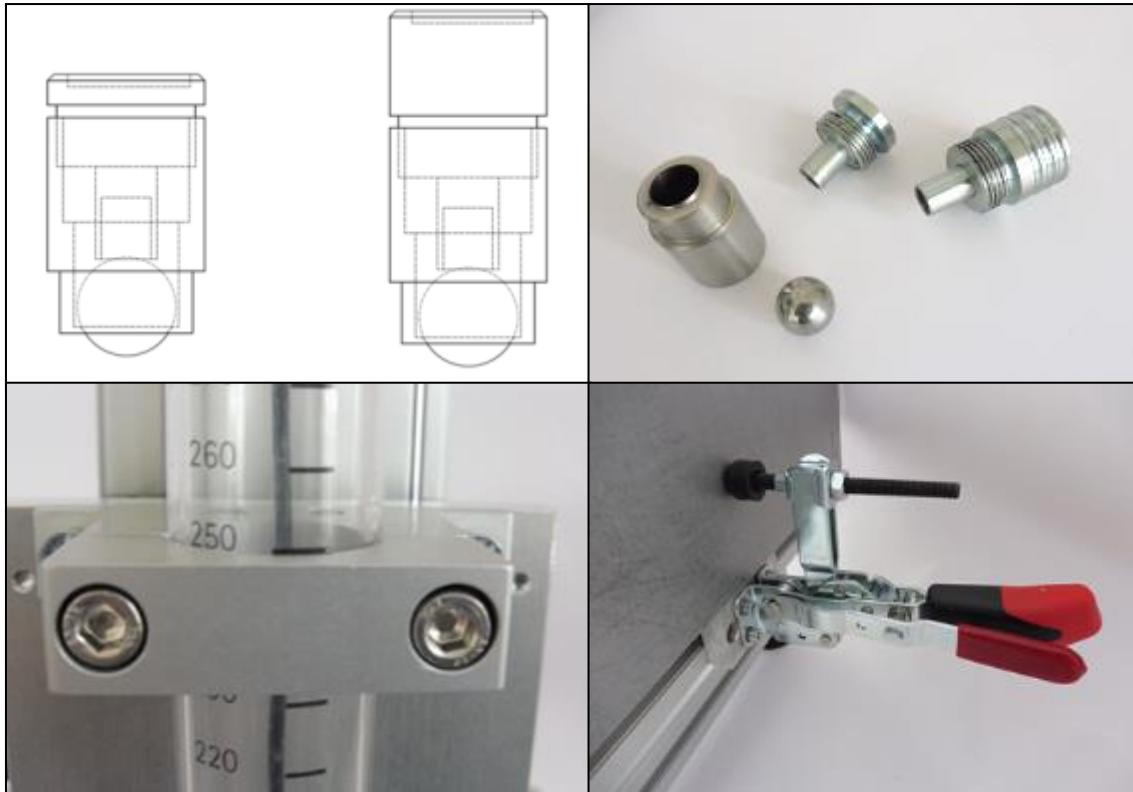

Mass change is realised through a defined weight of the upper part

100 g

150 g

100 g 150 g

Finished testing device for impact resistance

- + Suitable for all furniture fronts and worktops at both angles.
- + Clearly defined impact (falling mass and ball diameter).
- + Exchangeable ball with reasonable price (ca. 2-5 €).
- + Possibility of simple mass change – if necessary.
- + Good ability of positioning of the impact with two angles (45°, 90°).
- + Defined clamping of the sample.
- + Prevention of impact repetition possible.
- + Simple testing procedure, described in a draft Works Standard of IHD.
- + Test device will be commercially available at EPH Dresden after the project.

Material for the investigations of impact resistance

- Same type of adhesive per group and technology where other values vary
- Green – available material

| Variant | Substrate | Edge-Material type | Profile type |
|----------|---------------------------------------|---|-----------------|
| A-I-1 | Particleboard | HPL1 | flat |
| A-I-2 | Particleboard | HPL2 | flat |
| A-I-3 | MDF | Powdercoating (low bake) | Rounded |
| A-I-4 | MDF | Powdercoating (UV) | Rounded |
| A-I-5 | Melamine faced PB | ABS (1 mm, 2 mm thick) | flat |
| A-I-6 | Melamine faced PB | ABS (3 mm thick) | flat |
| A-I-7 | Particleboard | Postforming HPL | Rounded |
| A-I-8 | Particleboard | Postforming CPL | Rounded |
| A-I-9.1 | Wood soft | Wood lacquered | Ogee |
| A-I-9.2 | Wood hard | Wood lacquered | Ogee |
| A-I-10.1 | Wood soft | Wood lacquered | Roundover small |
| A-I-10.2 | Wood hard | Wood lacquered | Roundover small |
| A-I-11 | MDF + pigmented UV Coating | Pigmented 1K coating | Flat / other |
| A-I-12 | Melamine faced with pigmented coating | Melamine edge, band and pigmented coating | Flat |
| A-I-13 | Polyester with high gloss | Polyester (high gloss) | flat |
| A-I-14 | MDF with UV laquer 1 | Waterborne acrylic lacquer 1 | flat |
| A-I-15 | MDF with UV laquer 2 | Waterborne acrylic lacquer 2 | flat |

Investigation parameters

- Falling heights: 50..600 mm, steps of 50 mm
- Falling masses: 100 and 150 g
 - Goal: one mass, different falling heights.
- Ball diameter: 16 mm
- Impact on the rim (45°) and on the edge (90°)
- Colouration of the marks

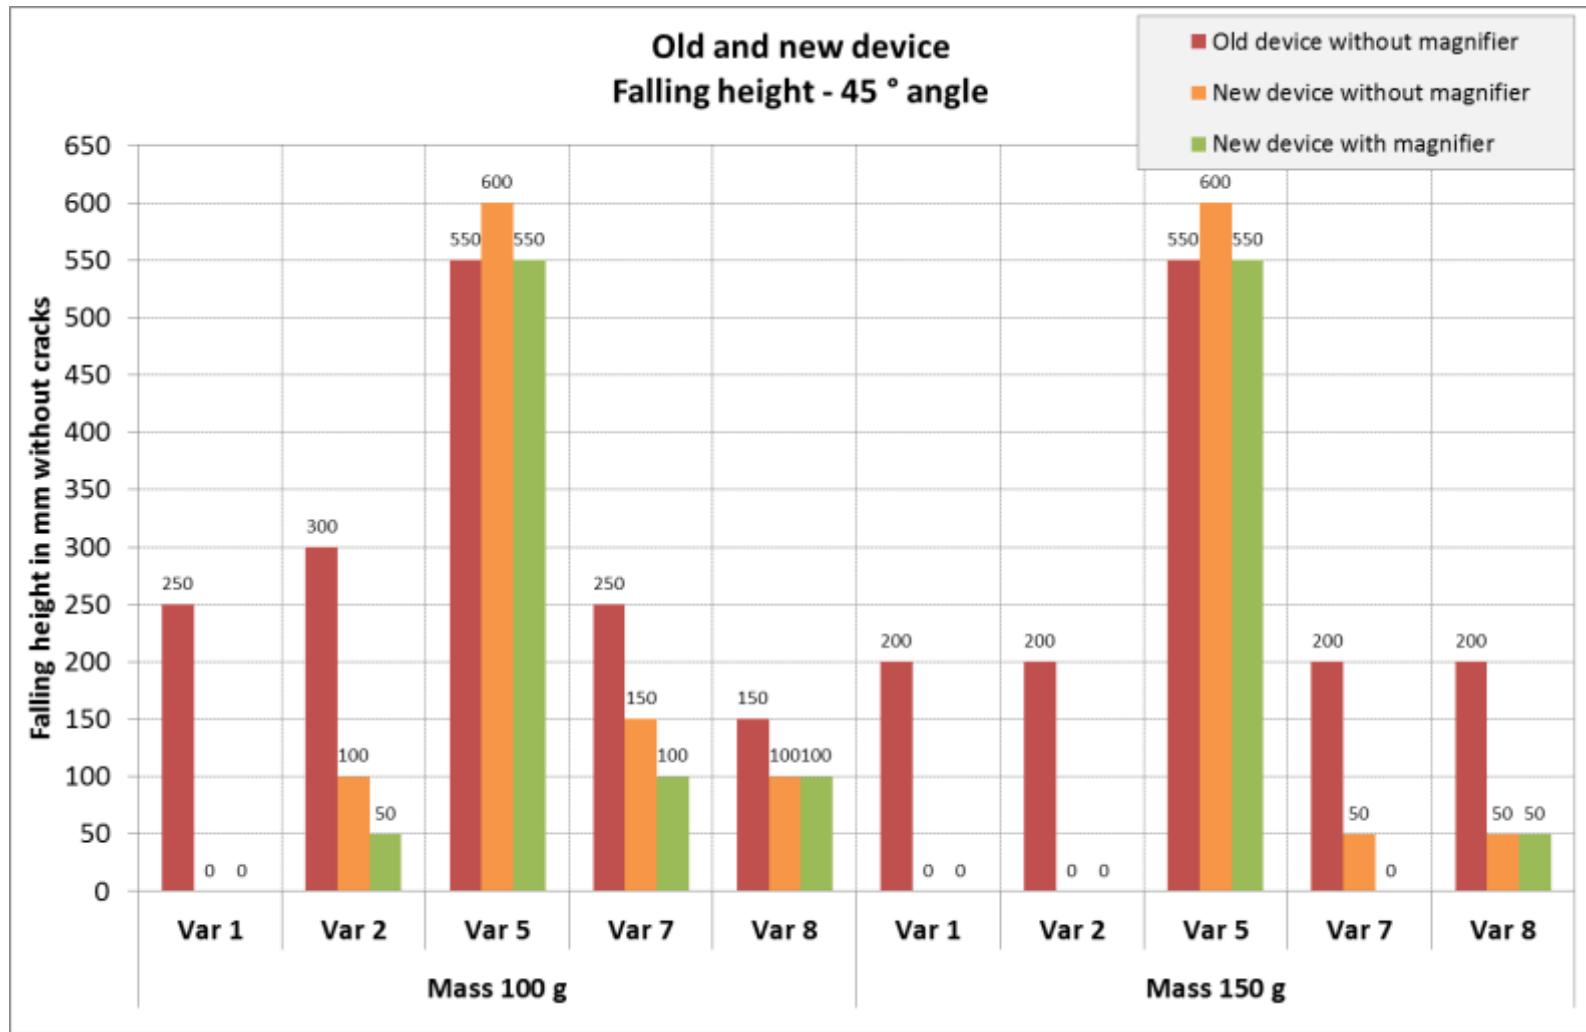

Assessment

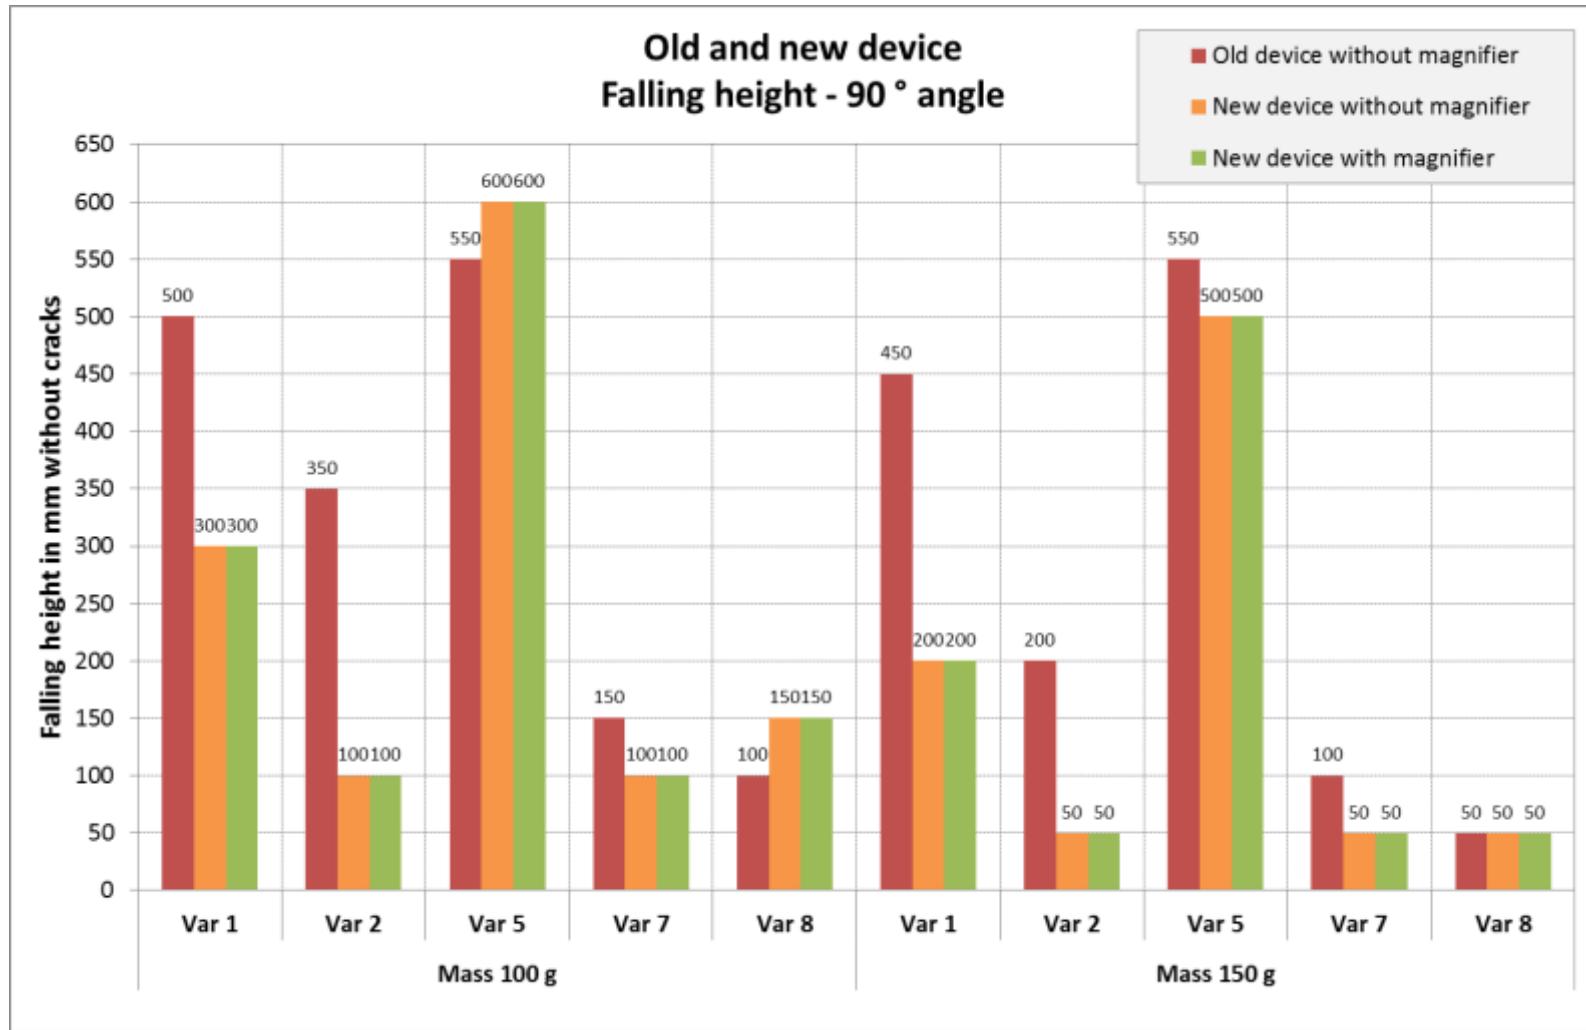

- Visual assessment using contrast powder (if necessary) and magnification glass (10x)
 - for comparison, also investigations without magnifier were carried out
- Assessment protocol:
 - "+" means "cracks spotted"
 - "-" means "no cracks"
- Result: The last falling height, at which no marks were spotted
 - "0" results possible!

Results: Old vs. new device, rim testing

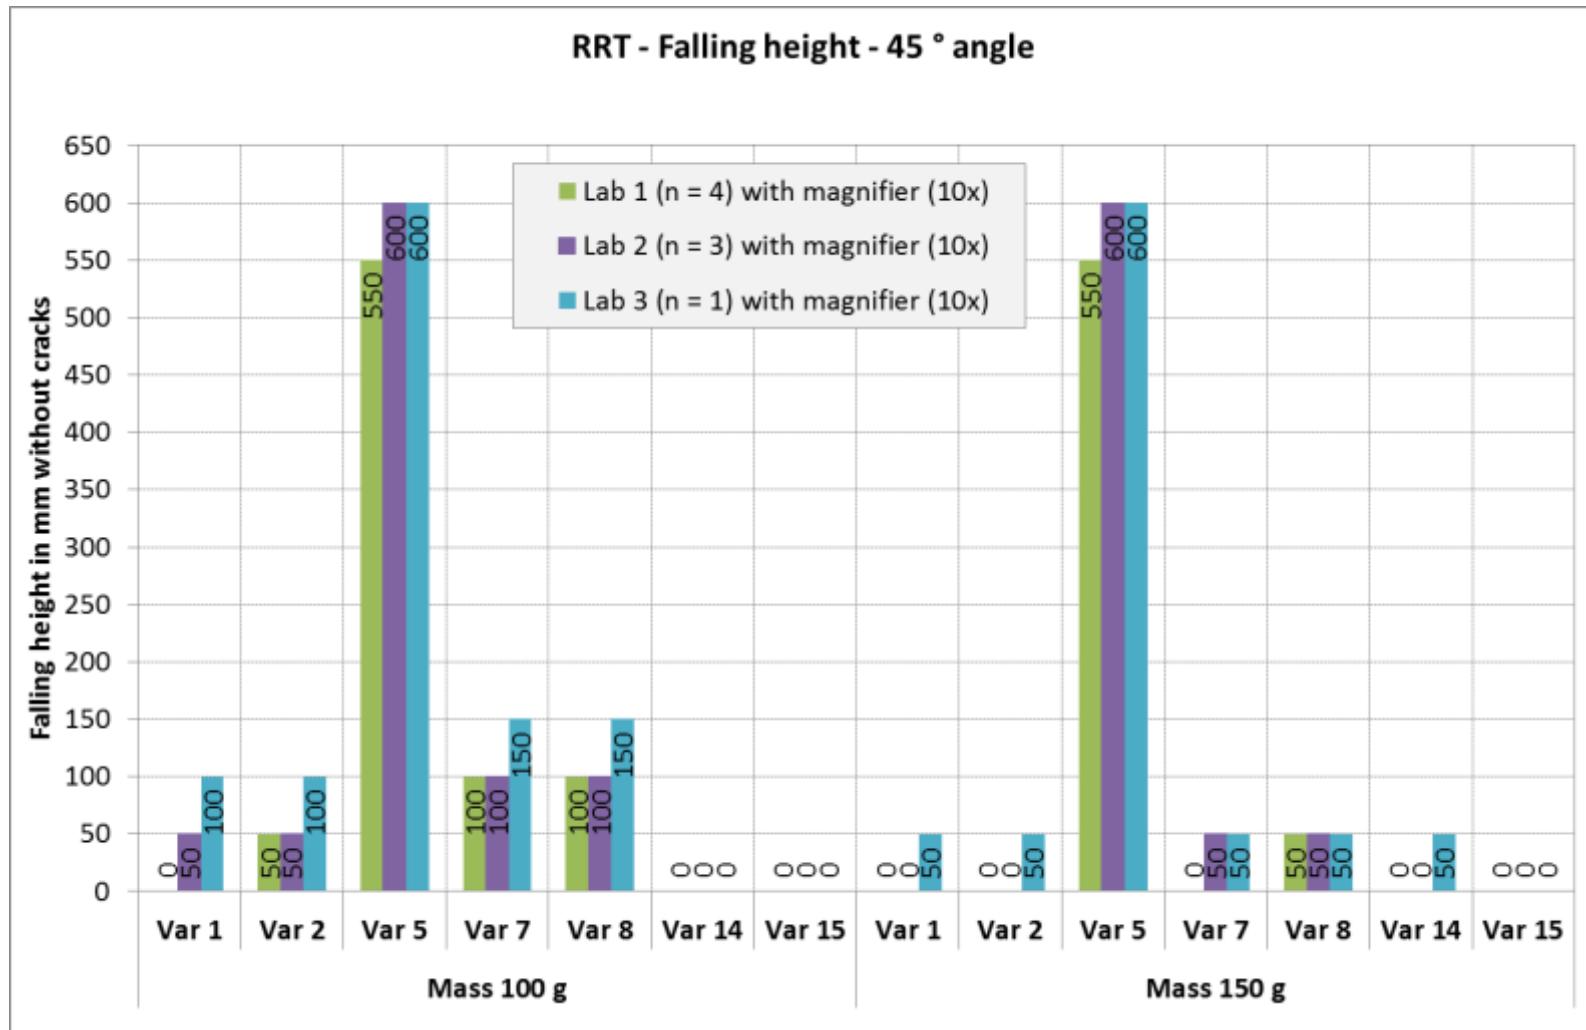

Results: Old vs. new device, edge testing

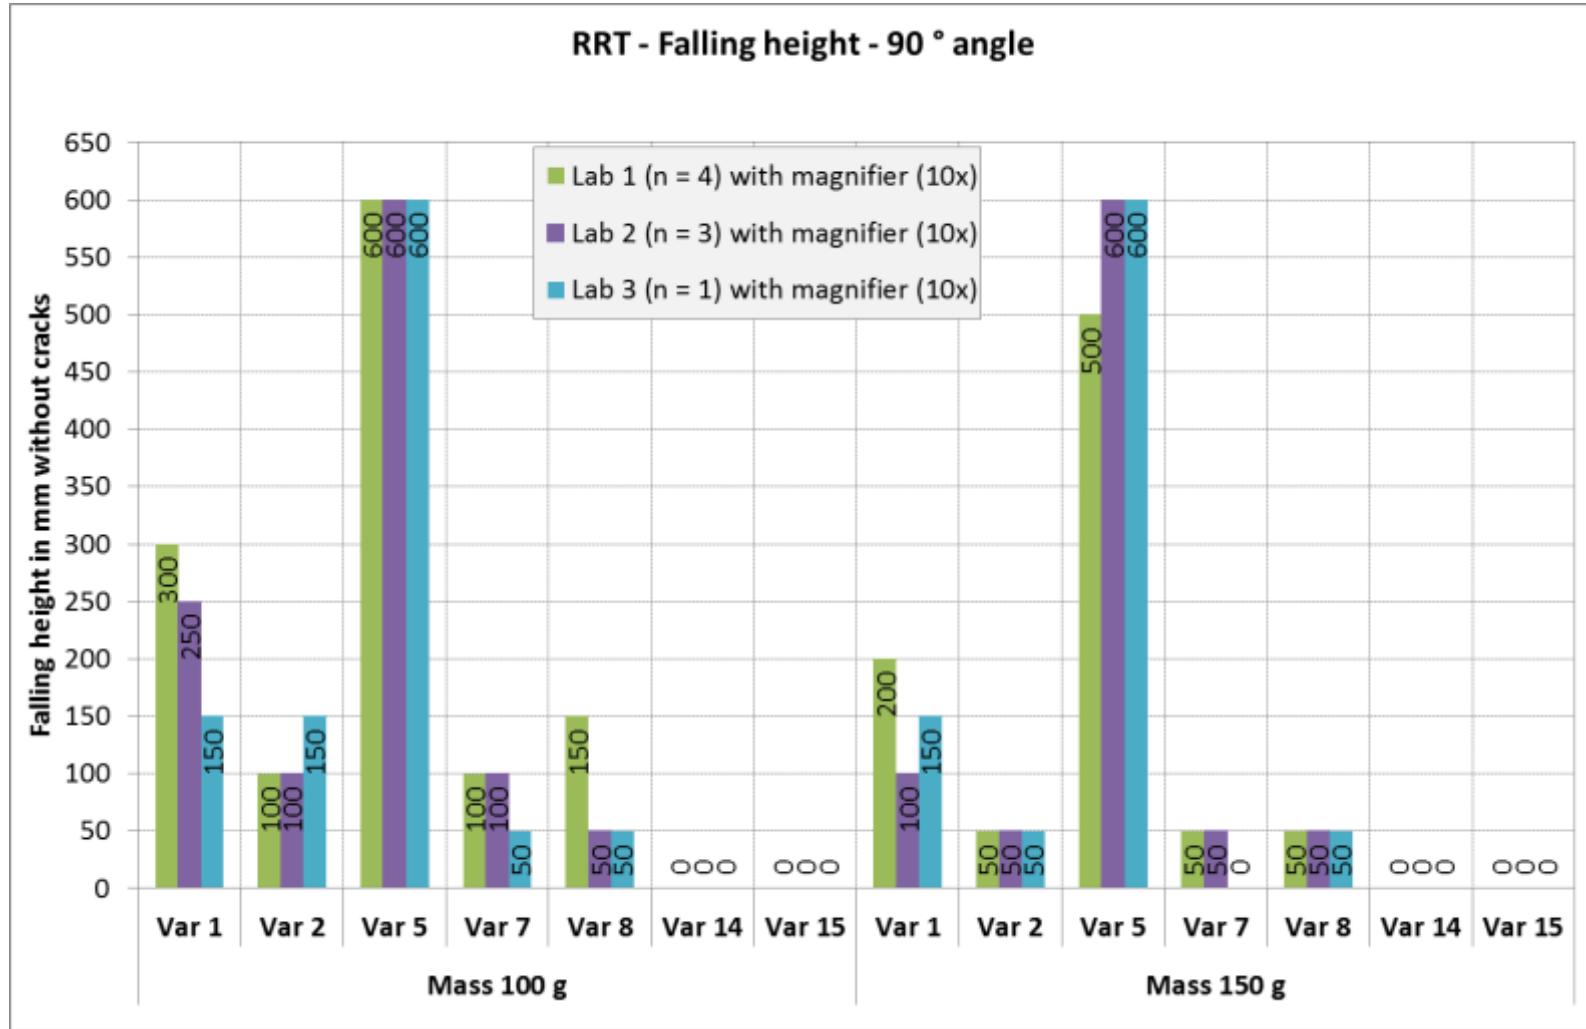

Results: Old vs. new device

- For the most materials, the falling heights without cracks are lower with the new device
 - For other cases, the height is the same or only one step higher
- Using magnifier lowers in some cases the result
- The new device allows a clear differentiation between the qualities
 - For lower mass, the differentiation possibility is higher

Preliminary results of the RRT (not finished yet!) – rim testing

Preliminary results of the RRT (not finished yet!) – edge testing

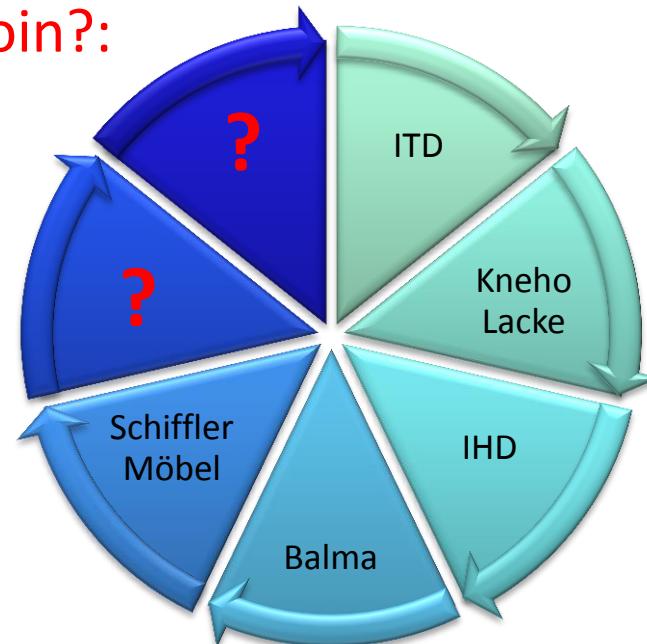

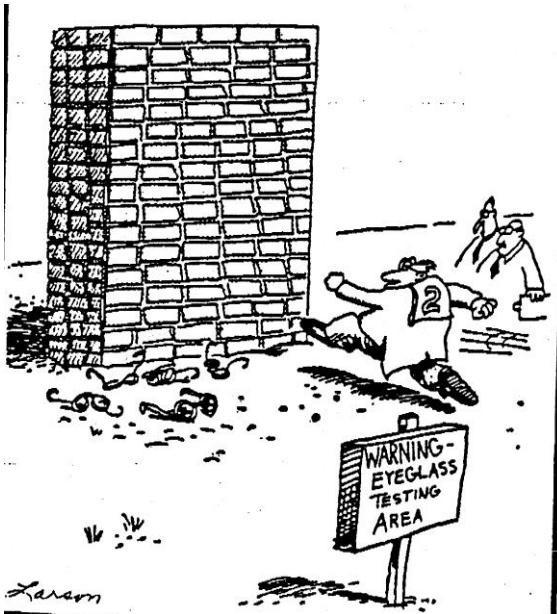

Preliminary results of the RRT

- The method seems to have a very good repeatability and reproducibility
 - this must be confirmed by further RRT participants
- Also the RRT has shown until now a clear differentiation between the qualities

Summary and further work

- The proposed method and device are suitable for rim and edge testing.
- Best parameters need to be found in the RRT.
 - Proposal: 100 g and 150 g, different heights (5-60 cm).
- RRT participants – who could join?:
 - ITD
 - Kneho Lacke
 - IHD
 - Balma
 - Schiffler Möbel
